**Composition**

**Active Ingredients**
- L-Cysteine
- L-3,4-Dihydroxyphenylalanine (L-DOPA)
- L-Methionine
- PTMBP / butanol
- L-Tyrosine
- Vitamin B1(Thiamine)
- Vitamin B3 (Niacinamide)
- Vitamin B5 (D-Pantothenic Acid)
- Vitamin B6 (Pyridoxine)
- Vitamin B8 (D-Biotin)
- Vitamin P (Rutin)
- Zinc Sulfate

**Amino Acids**
- L-Alanine
- L-Arginine
- L-Asparagine
- L-Aspartic Acid
- L-Glutamic Acid
- L-Glycine
- L-Histidine
- L-Isoleucine
- L-Leucine
- L-Lysine
- L-Phenylalanine
- L-Proline
- Pyruvic Acid
- L-Serine
- L-Threonine
- L-Tryptophan
- L-Valine

**Minerals**
- Ammonium Metavanadate
- Ammonium Molybdate 4H2O
- Calcium Chloride 2H2O
- Cupric Chloride 2H2O
- Cuprous Sulfate
- Ferric Sulfate 7H2O
- Magnesium Sulfate
- Manganese Sulfate
- Nickel Chloride 6H2O
- Potassium Chloride
- Sodium Phosphate Dibasic
- Sodium Selenite

**Vitamins**
- Choline Chloride
- Cobalamin (Vitamin B12)
- Folic Acid
- Myo-Inositol
- Riboflavin

**Other components**
- Adipine
- Benzyl Alcohol
- D-Glucose
- Phenol Red
- Pilocarpine
- Putresine
- Thymidine

**Packaging**
Box of 10 vials of 5.0 ml e.a.

**Dermal papilla and cycle of hair production**

Hair is extremely complex, consisting morphologically of several different cells and chemical species (Fig. 1). The hair root lies below the surface of the skin enclosed within a hair follicle which is in turn entirely encased in connective tissue and acts as the hair producing unit. The core of any hair follicle is the hair fiber, composed of three different types of epithelial cells: medullary, cortical and cuticular. The medulla, or innermost layer, is only present in large thick hair. The Inner Root Sheath (IRS) surrounding the hair fiber is composed of three cell types: the inner root sheath cuticle, Huxley’s layer, and Henle’s layer. This IRS is surrounded by another cellular envelope known as the Outer Root Sheath (ORS). These cells are in contact with the dermal papilla situated at the base of the hair follicle.

The dermal papilla is fed by the bloodstream, which carries nutrients to produce new hair, and plays an essential role in the induction and maintenance of hair growth.

Under normal circumstances, hair growth in each hair follicle follows a cycle consisting of three main stages (Fig. 2): anagen (growing phase), catagen (transition or rapid involution phase) and telogen (resting phase).

Normally, this cycle of hair production and inactivity will continue for the duration of the individual’s life. Other factors can, however, influence and inhibit hair production by aberrant hair follicle cycling and changes in the hair follicle morphology, leading in some cases to the physical destruction of the hair follicle. Pattern baldness or androgenic alopecia is the result of genetic programming for permanent destruction of the hair follicle. Pattern baldness or androgenic alopecia is the result of genetic programming for permanent hair loss, whereas increased hair shedding, or temporary hair loss, can have many different causes: poor nutrition and diet, hormones, age, medication, infections, stress, use of chemicals, rapid weight loss, illnesses, disease, hair-care practices, etc.

**KERACTIVE** reaches the hair at its root and in particular at the dermal papilla which is vital for the development of hair follicles. The formulation of **KERACTIVE** has been designed to stimulate new hair growth by rejuvenating damaged hair follicles and to create a healthy environment for new hair to grow.

**Indications**

**KERACTIVE** is particularly recommended:

- To treat non-androgenic alopecia
- To repair hair prematurely damaged by environmental aggressions (sun, pollution, diet, medication, etc.)
- To stimulate hair growth and health
- To treat female hair loss
- To eliminate dandruff and seborrhea
- To create a healthy environment for hair transplants
- To treat thin and/or devitalized hair

**Properties**

Under the influence of the dermal papilla, differentiation of the epidermal cells during the anagen stage produces a hair fiber and associated products. Insufficient dermal papilla cell stimulation results in a stoppage of the growth of the hair fiber and root sheaths. The dermal papilla can become isolated in the dermis and the hair fiber can easily be easily pulled out leading to hair loss. **KERACTIVE** slows down this process by providing the dermal papilla with the nutritional elements required for hair growth.

The primary component of hair fiber is keratin protein, a long chain of amino acids that forms the cytoskeleton of all epidermal cells. Research has evidenced that the durability and resistance of hair fiber to degradation under environmental stress stem from the high amount of sulfur which comes from the amino acid, cysteine, in the hair fiber. The sulfur in the cysteine molecules in adjacent keratin fibers to degradation under environmental stress stem from the high amount of sulfur which comes from the amino acid, cysteine, in the hair fiber. The sulfur in the cysteine molecules in adjacent keratin proteins binds to form disulfide chemical bonds which are very strong and very difficult to break apart. **KERACTIVE**, by ensuring a permanent bio-availability and a proper ratio of all the amino acids present in healthy hair, optimizes the production of keratin proteins.

The cells in hair follicles produce all the keratin they require from the nutritional and energetic metabolism. **KERACTIVE** also contains all the metabolites (vitamins and minerals) required for proper functioning of the nutritional and energetic metabolism. **KERACTIVE** is particularly rich in vitamin B which (especially when combined with zinc) prevents hair shedding and regulates sebum secretion and dandruff caused by the build up of cellular debris which asphyxiates the hair follicles. Graying is also attenuated by Vitamin B and by DOPA, a melanin precursor.

Minerals (zinc, selenium, copper, manganese) known for their anti-oxidant properties and their role in enzymatic reactions leading to hair growth and repair are also brought by **KERACTIVE**.
